Abstract
The novel coronavirus, SARS-CoV-2, has spread across the world within months of its first description in Wuhan, China in December 2019, resulting in an unprecedented global health emergency. Whilst Europe and North America are the current epicentres of infection, the global health community are preparing for the potential effects of this new disease on the African continent. Modelling studies predict that factors such as youthful and rural population may be protective in mitigating the spread of COVID-19 in the World Health Organisation (WHO) African Region, however, with 220 million infections and 4.6 million hospitalisations predicted in the first year of the pandemic alone, fragile health systems could still be placed under significant strain. Furthermore, subsequent disruptions to the provision of services for people living with HIV, or at risk of acquiring HIV, are predicted to lead to an extra 500,000 adult HIV deaths and a 2-fold increase in mother to child transmission of HIV in sub-Saharan Africa in 2020-2021. Ignoring these predictions may have severe consequences and we risk “stepping back in time” in AIDS-related deaths to numbers seen over a decade ago. Reflecting on our current experience of the COVID-19 pandemic in Uganda, we explore the potential impact of public health measures implemented to mitigate spread of COVID-19 on the HIV care continuum, and suggest areas of focus for HIV services, policy makers and governments to urgently address in order to minimise the collateral damage.

Amendments from Version 1

Abstract:
Article “a” has been removed from “a youthful and rural population”

Introduction:
Covid confirmed cases and deaths updated to current global figures.
Article “a” added to “younger and more rural population”.

“Though the article makes reference to the fact that Uganda may have successfully curbed the spread of COVID-19, there is limited evidence such as delayed community transmission, limited number of cases, reducing new infections to support the statement” was added.

Covid 19 challenges and HIV care continuum in Uganda:
PLWHIV changed to PLHIV (People living with HIV) throughout the paper, “and instituted control measures” added to sentence in paragraph 2.
“Global lockdowns and travel restrictions threaten manufacture and supply, particularly to tenofovir-lamivudine-efavirenz and tenofovir-lamivudine-dolutegravir, which is first line therapy for an estimated 80% of PLHIV in low- and middle-income countries. Lopinivir and ritonavir global supply was also particularly threatened, given initial interest in its use as an experimental therapeutic agent for COVID-19” added to bring out interruption in ART supply chain
Respective references added.

Improved epidemic preparedness:
In the last 5 months updated to “last 1 year”

Any further responses from the reviewers can be found at the end of the article

Introduction
Coronavirus disease 2019 (COVID-19), caused by the novel severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), was first described in Wuhan, China in December 2019 and to date there have been more than 106,375,662 confirmed cases, with at least 2,321,294 deaths, globally1. Recent modelling studies predict fewer deaths and severe infections in Africa compared to the United States and Europe, potentially due to a younger and more rural population. Despite this, it is predicted that within the first year nearly a quarter of Africa’s 1 billion population may be infected with the pandemic continuing for a longer period with 4.6 million hospitalisations, which will still pose a significant strain on health systems2,3. Sobering estimates from World Health Organisation (WHO) and UNAIDS suggest a disruption in antiretroviral therapy (ART) due to COVID-19 could lead to more than 500,000 extra deaths from AIDS-related opportunistic infections in sub-Saharan Africa and reverse gains made in preventing mother-to-child transmission of HIV, with an increase in new child infections of up to 104% in Uganda4. These figures were described by Dr Tedros Adhanom Ghebreyesus, Director-General of the WHO as “stepping back into history”5. In this commentary, we present Uganda as an example of a sub-Saharan African country who quickly enacted strict containment measures. Though the article makes reference to the fact that Uganda may have successfully curbed the spread of COVID-19, there is limited evidence such as delayed community transmission, limited number of cases, reducing new infections to support the statement. The success of these containment measures may result in profound consequences on the HIV care continuum. We suggest globally applicable measures for HIV service providers, government and policy makers to urgently consider in order to minimise the lasting collateral damage to HIV prevention and treatment efforts threatened by this pandemic.

COVID-19 challenges and the HIV Care Continuum in Uganda

Uganda has a population of almost 43 million people including 1.4 million people living with HIV (PLHIV)6. Excellent progress has been made towards the UNAIDS “90-90-90” 2020 targets with 84% of the population aware of their HIV status and 87% of these on ART, of which 88% of people are virally suppressed. At its peak in the 1990’s, Uganda’s HIV prevalence was 18–30%, which was reduced to 5.7% in 2019, largely due to the roll out of antiretroviral therapy (ART) and extensive public health campaigns around the importance of HIV testing, initiating ART and counselling on drug adherence7.

The current pandemic and instituted control measures threatens to reverse these accomplishments. As soon as the first case of COVID-19 was identified in Uganda on 19th March 2020, strict lockdown measures were enforced, including a ban on all public and private transport, night curfew, closure of schools, suspension of religious and social gatherings, and closure of non-essential shops and markets8. Firstly, these measures present barriers to HIV testing, in particular initiatives for testing Uganda’s most vulnerable groups, including workplace testing, mobile mass testing campaigns and self-testing amongst fishermen, sex-workers and male partners of women attending antenatal care9. For those with a new diagnosis of HIV, closures of clinics and the practicalities of leaving the house during lockdown prohibit essential linkage to care. However, our greatest concern is the real possibility of substantial ART interruption. Global lockdowns and travel restrictions threaten manufacture and supply, particularly to tenofovir-lamivudine-efavirenz and tenofovir-lamivudine-dolutegravir, which is first line therapy for an estimated 80% of PLHIV in low- and middle-income countries9. Lopinivir and ritonavir global supply was also particularly threatened, given initial interest in its use as an experimental therapeutic agent for COVID-1910. In Uganda, this is likely multifactorial: supply chain issues as borders are closed, the inability of people to leave their homes to obtain essential medications, and people relocating to villages away from their HIV clinics. Additionally, there is the dire situation of poverty and hunger faced by many individuals, where mere survival rather than maintaining HIV care has become the priority. This disruption in ART access has very real consequences on those who were previously adherent to ART and virologically suppressed. Significant lapses in HIV virological suppression may result in increased community transmission of HIV in Uganda and other comparable settings, which would represent a catastrophic downstream effect of COVID-19 (Figure 1).
Minimising collateral damage: focus points for HIV service providers, policy makers and Government

We suggest four focus points for HIV service providers, policy makers and governments to minimise collateral damage of the COVID-19 pandemic in Uganda, which are applicable to similar sub-Saharan African countries (Figure 2).

1. **Increase in innovative, adaptive, decentralised, community-based care.** It is increasingly recognised that successful HIV care depends on adapting to the individual’s needs and expectations, especially in a pandemic\(^\text{11}\). One such measure already recommended by WHO in response to COVID-19 is multi-month ART prescriptions for stable patients\(^\text{12}\). However, ongoing maintenance of HIV care will require proactive steps by HIV services, backed by adequate government funding and donor support. Adaptions to service delivery, such as telemedicine, must be incorporated so that clients can access essential care during prolonged lockdown. Hotlines should be set up in the event of an emergency, providing mobile credit allowance or toll-free numbers. Since less than 50% of the Ugandan population own a mobile phone, there should be provision of simple handsets or access to a shared community phone. For those who have relocated back to rural communities, issuing a universal HIV passport allowing clients to access medication at any clinic would prevent unintentional ART interruption. Ensuring PLHIV have adequate food, water, soap and access to essential concomitant medications such as cotrimoxazole and fluconazole, are also essential and is something we have prioritised for the most vulnerable clients through donations at the Infectious Disease Institute, Kampala.

2. **Increased community engagement.** The community of PLHIV, particularly in Uganda, has a strong history of activism and peer support. For example, many HIV services have community advisory boards comprised of patient representatives, religious and community leaders. In these challenging times, existing community networks, social media, radio and television should be leveraged to disseminate important public health messages pertaining to both COVID-19 prevention and HIV care, including HIV testing, ART adherence and encouraging people to access healthcare when needed, even during lockdown periods.

3. **Healthcare system strengthening.** Uganda has strong vertical health programmes such as HIV, TB and malaria control programmes; however, pandemics quickly expose lack of horizontal integration and a fragile surrounding healthcare infrastructure\(^\text{13}\). COVID-19 will hopefully provide a wake-up call to government, donors and policy makers to invest in strengthening the Ugandan healthcare system so that essential HIV care can be maintained despite increased pressures posed by the pandemic. This should include increased training and retention of nursing, medical and auxiliary healthcare workers, ensuring adequate stock of medications and diagnostic...
laboratory equipment and provision of increased high-dependency unit beds and oxygen supply within government healthcare facilities, the only healthcare available to most Ugandans.

4. Improved epidemic preparedness. In the last 1 year, epidemic preparedness has become a top priority worldwide. In fact, at this time the global community might consider looking to Uganda’s experiences managing infectious epidemics such as HIV, Ebola, and Marburg for lessons in their own COVID-19 responses. Thankfully, COVID-19 spread in the African continent is predicted to be slower than in Europe and the United States, giving governments some time to prepare their responses. Nevertheless, ongoing efforts are required to upscale testing and contact tracing, rapidly train and mobilise a COVID-19 workforce, source adequate personal protective equipment (PPE) and ensure adequate access to adequate clean water, soap, and sanitizers for both healthcare facilities and the general population. In addition, emphasis should be placed on mobilisation of funds and streamlined regulatory processes to facilitate context-specific research on the epidemiology and clinical course of COVID-19 in PLHIV, to avoid reliance on research findings being extrapolated from the global North.

**Conclusion**

Failing to recognise the potential impact of the current pandemic on the HIV care continuum in Uganda, and similar sub-Saharan African countries, could result in a huge upsurge in HIV transmission and deaths in the months and years to come. In addition, increasing global travel, urbanization and changes in land use mean that future pandemics are almost inevitable. Substantial action must be taken now by HIV service providers, policy makers and governments in sub-Saharan Africa to create innovative, sustainable and effective solutions to prevent us “stepping back in time” in HIV care and minimise the collateral damage of COVID-19 on the HIV care continuum.

Thank you for the opportunity to review this commentary on minimizing the collateral damage of
the HIV care continuum due to COVID-19. The authors present a clear and informative overview of
the myriad of challenges (figure 1) and solutions to mitigate the impact (figure 2) of COVID-19.
This is a noteworthy contribution to the literature given Uganda's success in almost meeting the
UNAIDS 90-90-90 targets. In addition to the comments provided by our colleague, Tolulope
Tokunyori Oladele, I have a few minor suggestions that could strengthen this manuscript.

Abstract:

Determine whether the third sentence should be re-worded to say: "Modelling studies predict that
factors such as youthful and rural populations may be protective in mitigating the spread of
COVID-19 in the World Health Organisation (WHO) African Region...." instead of "a youthful and
rural population."

Introduction/Main text:

Similar to the abstract, in the second sentence, I think there population should be plural OR it
should read "a younger and more rural population".

1. Increase in innovative, adaptive, decentralised, community based care.

- Are any of these recommendations based on interventions that have been implemented in some
capacity in Uganda or anywhere else? If so, it'd be helpful to cite or reference them so readers can
easily find the information and resources (e.g. telemedicine in rural settings and HIV passport
usage).

This recommendation could be applied throughout other sections where applicable.

Is the rationale for the Open Letter provided in sufficient detail?
Yes

Does the article adequately reference differing views and opinions?
Yes

Are all factual statements correct, and are statements and arguments made adequately
supported by citations?
Partly

Is the Open Letter written in accessible language?
Yes

Where applicable, are recommendations and next steps explained clearly for others to follow?
Yes

Competing Interests: No competing interests were disclosed.
Reviewer Expertise: HIV/AIDS, aging, resilience, LGBTQ health disparities, psychosocial stressors, housing instability.

I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard, however I have significant reservations, as outlined above.

Author Response 07 Feb 2021

Enock Kagimu, Infectious Diseases Institute, College of Health Sciences, Makerere University, Kampala, Uganda

Reviewer 2 (Kristen D. Krause)

We sincerely thank the reviewers for their expert critique and constructive suggestions. We have responded to each comment in turn.

Abstract:
Determine whether the third sentence should be re-worded to say: "Modelling studies predict that factors such as youthful and rural populations may be protective in mitigating the spread of COVID-19 in the World Health Organisation (WHO) African Region..." instead of "a youthful and rural population."

This has been adjusted.

Introduction/Main text:

Similar to the abstract, in the second sentence, I think there population should be plural OR it should read "a younger and more rural population".

Article “a” has been added to the sentence

1. Increase in innovative, adaptive, decentralised, community based care.

- Are any of these recommendations based on interventions that have been implemented in some capacity in Uganda or anywhere else? If so, it'd be helpful to cite or reference them so readers can easily find the information and resources (e.g. telemedicine in rural settings and HIV passport usage). This recommendation could be applied throughout other sections where applicable.

Thank you for this comment. Yes, some of these recommendations have been tried out in Uganda though not much data captured for good referencing as some are still being tried out where as some are suggestions for better improvement.

Competing Interests: No Competing interests
The article highlights the need for a continued focus on HIV despite the ongoing COVID-19. This is to prevent a reversal of gains already achieved in the fight against HIV citing Uganda as an example. A framework describing how this can happen is provided. Four focus point which HIV service providers, managers and government should note is provided. The article is well written, in clear English and easy to understand.

Addressing the following points will improve the quality of the article:

**Introduction:**
1. The number of cases and deaths should be updated to the most recent figures.
2. The article "a" should come before "younger" in Line "4".
3. Though the article makes reference to the fact that Uganda may have successfully curbed the spread of COVID-19, there is limited evidence such as "delayed community transmission, limited number of cases, reducing new infections" to support the statement. These should be included.

**COVID-19 challenges and the HIV Care Continuum in Uganda:**
1. The more general abbreviation for "people living with HIV is PLHIV", the authors may consider its usage.
2. The phrase " and instituted control measures" should be added" to the statement "the current pandemic threatens to reverse these accomplishments" as it is the lock-down measures such as restriction of movement that have greatly impacted on access to HIV services.
4. Secured funding is a critical component of minimizing collateral damage to HIV. The authors should consider bringing out this point separately from **focus point 1** - increase in
innovative, adaptive, decentralized, community-based care.

Is the rationale for the Open Letter provided in sufficient detail?  
Yes

Does the article adequately reference differing views and opinions?  
Yes

Are all factual statements correct, and are statements and arguments made adequately supported by citations?  
Partly

Is the Open Letter written in accessible language?  
Yes

Where applicable, are recommendations and next steps explained clearly for others to follow?  
Yes

**Competing Interests:** No competing interests were disclosed.

**Reviewer Expertise:** HIV/AIDS, Health Economics, Obstetrics & Gynaecology

I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard, however I have significant reservations, as outlined above.

Author Response 07 Feb 2021

**Enock Kagimu**, Infectious Diseases Institute, College of Health Sciences, Makerere University, Kampala, Uganda

**Reviewer 1 (Tolulope Tokunyori Oladele):**

We sincerely thank the reviewers for their expert critique and constructive suggestions. We have responded to each comment in turn.

**Introduction:**

- The number of cases and deaths should be updated to the most recent figures.
  
  These have been updated.

1. The article "a" should come before "younger" in Line "4".

   Article “a” has been added.

- Though the article makes reference to the fact that Uganda may have successfully curbed the spread of COVID-19, there is limited evidence such as “
delayed community transmission, limited number of cases, reducing new infections" to support the statement. These should be included.

Thank you for the suggestion, this statement has been added.

COVID-19 challenges and the HIV Care Continuum in Uganda:

- The more general abbreviation for "people living with HIV is PLHIV", the authors may consider its usage.
  This has been changed to PLHIV throughout the paper

- The phrase "and instituted control measures" should be added" to the statement "the current pandemic threatens to reverse these accomplishments" as it is the lock-down measures such as restriction of movement that have greatly impacted on access to HIV services.
  This has been added to that line.

  Thank you for the suggestion, this has been expounded and a reference to this added.

- Secured funding is a critical component of minimizing collateral damage to HIV. The authors should consider bringing out this point separately from focus point 1 - increase in innovative, adaptive, decentralized, community-based care.
  Thank you our dear reviewer, the point of secured funding has been noted in the epidemic preparedness section.

**Competing Interests:** No competing interests
